

Ordering Archetypes

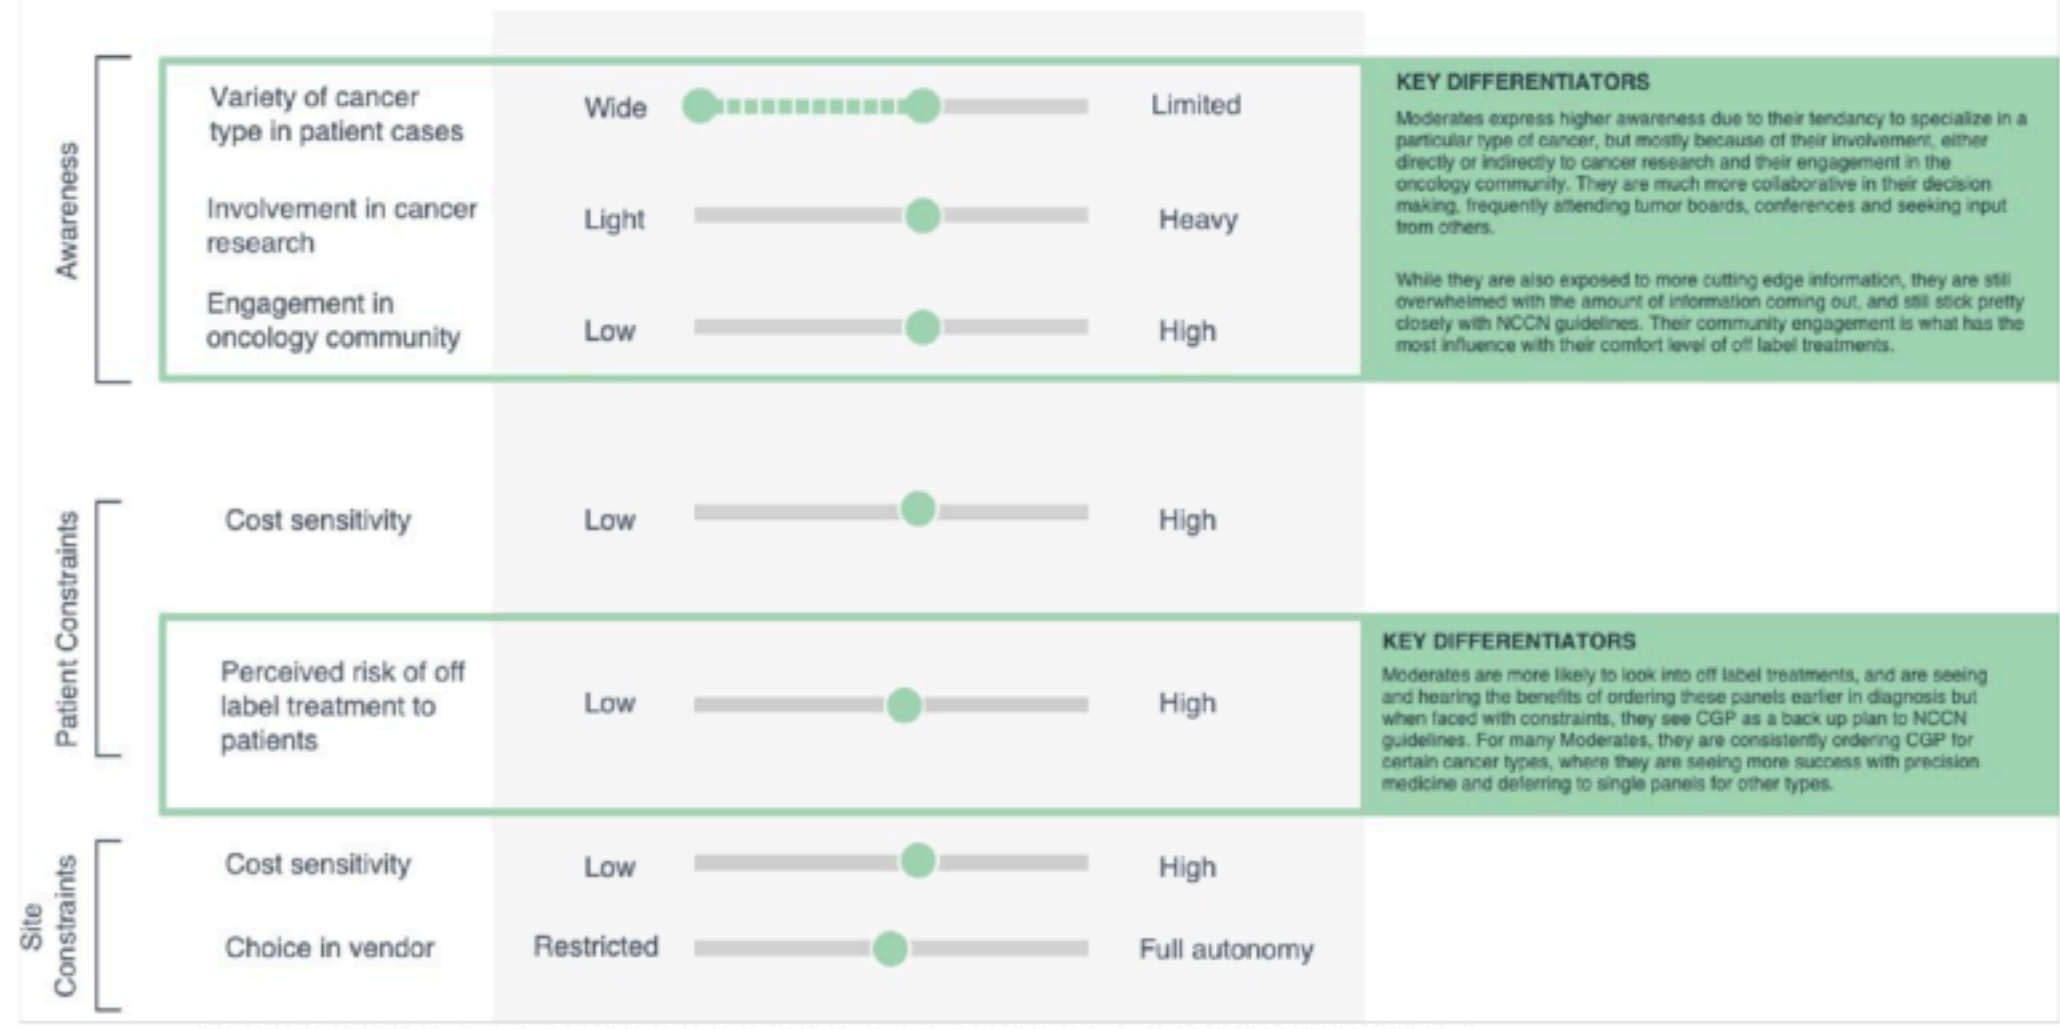

Progressives

Progressives are the biggest believers in comprehensive genomic profiling, regardless of the case or constraints. They are also the most comfortable with prescribing off label treatments, although they do agree that the NCCN guidelines are usually the correct approach. Due to their specialization, they are often seeing cases where these guidelines may not apply. They are always seeking the most current information and are highly engaged in the oncology community and while they are usually directly involved with cancer research, they can be indirectly involved as well. They usually come from a background of lab research with a desire to be involved in clinical care.

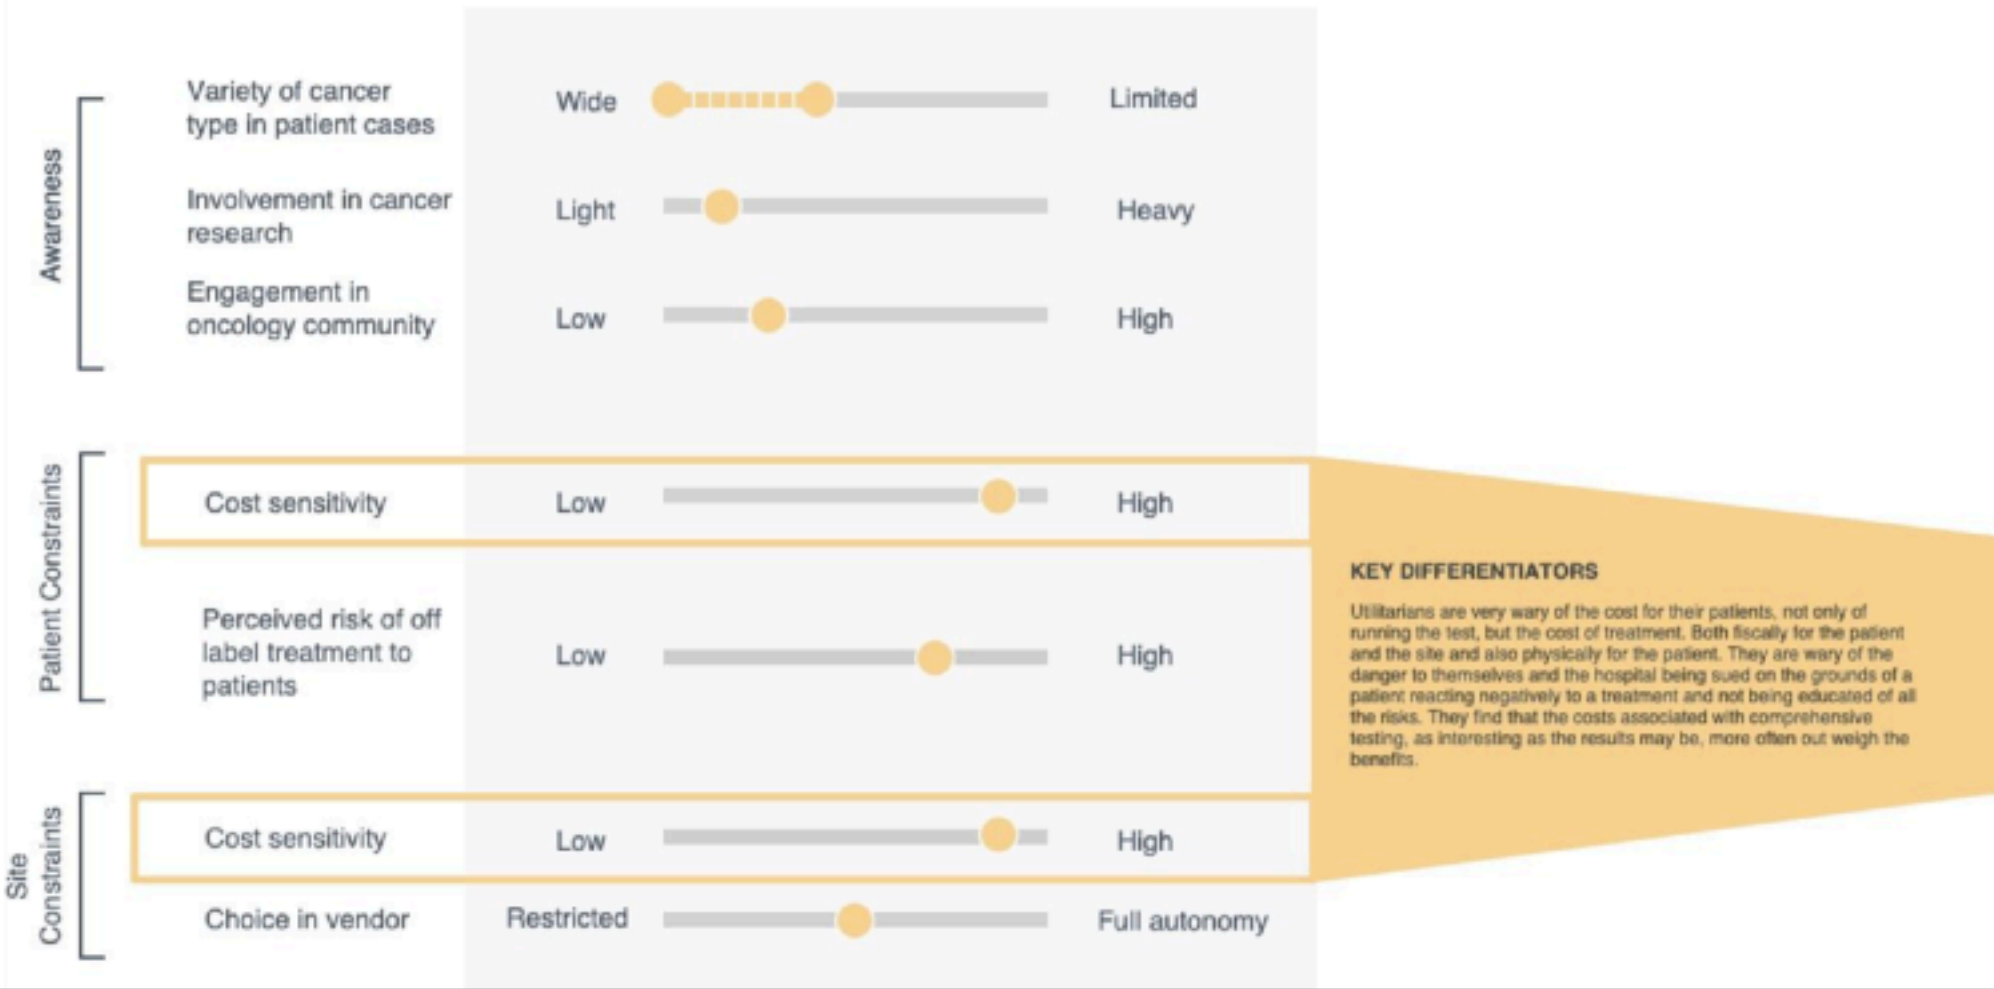

Moderates

Moderates are oncologists that because of their awareness and exposure to more off label treatment options are more comfortable with prescribing these options to their patients. They can be more general in their practice but usually have more specialization into one type of cancer. They are very engaged in the oncology community and are seeing the benefits of comprehensive genomic panels and are encourage to order them more often than their By the Book and Utilitarian peers. They also exhibit a more active interest in cancer research and the science behind precision medicine and this interest is often what drew them to oncology in the first place.

Utilitarians

Utilitarian oncologists are very similar to their By the Book colleagues in their caution, although this largely comes from their sensitivity to cost, both with the patient and their site. They see comprehensive genomic profiling as expensive and that the treatment options that results from it are often unactionable because they are off label. These oncologists are less likely to see off label therapies as actionable because they find that the NCCN guidelines are nine times out of the the best approach, but also they are riskier because as they tend to be more generalists in the cancer cases they see, they aren't thoroughly aware of the risks and benefits to their patients.

By the book

By the book oncologists are the most cautious of the oncologist types. They adhere very strongly to guidelines, are usually late adopters of new treatments and prefer to stick with treatments that are "tried and true," or at the very least that are indicated. They don't place a high value on comprehensive testing when making treatment decisions. They find targeted genomic testing to be much more useful to them. Their reasoning is that the results of a comprehensive test is too much information that they don't need and they don't have actionable options for treatment.
