

Findings & themes

- Many of the portal's interfaces do not conform to current design standards and user expectations, creating an **inconsistent and confusing experience**.
- **Navigation to and from different parts of the portal is confusing** and sometimes non-existent, confusing and frustrating users.
- **The portal does not promote its' value to users:** there is no language on either the login or dashboard screens that explains to users what they can use the portal for.
- The login and forgot password flows are confusing, and oncologists have stated that they **"do not want to remember yet another password."**
- **The portal is not customized to our users' individual needs**, missing communication and notification preferences, the ability to add team members to an account, and displaying favorites or frequently used functions.
- **The test order form is painfully long and often requires a user to leave/pause to complete associated paperwork (i.e., ABN and LMN forms)** — and the form continues to grow with new assays and IHC options.

Findings & themes

- **Completing an order often becomes a collaborative task**, requiring oncology support staff to fill out the order out as a physician's proxy — however, the portal does not support these collaborations well.
- **There is little explanation on which test a user might want before they begin filling out the order** — and no assurance that they can change the test type.
- **No transparency or explanation about the backend logic** that suggests CGP and IHC tests based on disease ontology in the order form.
- **No description given for our current IHC offerings.**
- **There is no help functionality built into the portal**, leaving many users confused and having to rely on calling FMI to ask questions.
