

Design Sprints

Patients List

Purpose

Primary way of browsing patient information. View patients by most recent report and see top-level genomic findings. In the future, allow the user to perform deep interactions with patient records including robust filtering and cohorting.

Antipurpose

Showing order information, providing full results for each patient.

Features / Widgets

Report indicator

First columns shows whether the patient has an order in progress or an unread report available.

DOB & MRN

Primary discriminators for patients that share a name or are otherwise easily confused.

Last Reported

Sorted column by default, intended as a way of defining which patients are "recent"

Tumor Type & Genomic Findings

Top level medical information, used in future state for grouping similar patients together. nNecessary for parity with legacy portal.

Use cases for the patient page:

- As a user, I need to build patient cohorts so that I can download and compare their results
- As a user, I need to see my patients that have had recently had FMI tests
- As a user, I need to see any patients with orders in progress
- As a user, I need to see top-level genomic findings before diving into a particular patient
- As a user, I need to search patients by date of birth, in the case that I have multiple patients with the same name

Add Patient

make search a bigger, more prominent place?

like adding a patient, makes sense for workflow

probably no delete, except maybe for admin? probably only soft delete at most? just reach out to FMI if needed

start a new order download most recent report download all reports (3)

is "tumor type" right? what's the most valuable information to see here?

this is blank if they haven't had any reports?

jump to order, jump to report - make this more action focused

copy link?

columns more focused on demographics?

provider? facility?

not relevant for every user? can this be configurable?

filter out by date? reported between x and y dates

search by name, dob, status, patients with new reports, active orders.

search probably more important than filters here,

quick, my patient just came in! go into the portal and do _____.

HIPAA

how monitoring works here?

"completed orders" "orders with results"?

make this language consistent across the portal

avg patient probably has 1 order, some might have up to 3, monitoring is an exception and needs more thinking
