

Test Selection Workshop

Panel Test

Definition: Placing a single order for multiple tests that are often ordered together

- "Panel test" – (Northwestern) – procedure where a series of tests is performed on one specimen
 - Widely accepted for internal and external

Ordering: Multiple tests ordered in a single transaction

Samples:

Specimen Types: Can be the same sample for multiple tests, or separate samples depending on test selection

Received: Arriving simultaneously (ideal state)

Test Execution: Run concurrently

Concurrent Testing Orders

Note: concurrent testing is an industry term used by insurers for the combination order of solid and liquid tests only.

Definition: Placing a single order for both a liquid and tissue test to retain a tumor profile and ctDNA results

Ordering: Liquid and solid tests ordered in a single transaction

Samples:

Specimen Type: Liquid and tissue samples

Received: procured simultaneously (ideal state)

Test Execution: Run concurrently or at time of specimen arrival

Note: Concurrent testing is a type of combination order

Reflex Orders

Definition: Auto authorizing an additional test to be performed if the initial test failed, or results that require more information.

Ordering: Both tests can be ordered at the same time or at a later point as a follow-on test.

Samples:

- Specimen Types: Solid and liquid
- Received: The second sample is requested after the initial test result is available
 - Exception: RNA is partially concurrent in reflex cases. Coextraction is done but is held until DNA result is complete

Test Execution: Conditionally sequential

Standing Orders

Definition: Pre-selected test combinations based on the preferences of the individual physician, facility, or account designed to ease clerical burden. Generally these are based on persons of pre-defined "circumstances"

Ordering: Multiple tests ordered in a single transaction

Samples:

Specimen Types: Can be the same sample for multiple tests, or need for separate samples depending on selection

Received: Arriving simultaneously (ideal state)

Test Execution: Runs concurrently or sequentially

Serial Orders

Definition: A physician determining a set cadence to monitor patient's progress

Ordering: All tests in a series are ordered in a single transaction

Samples:

Specimen Type: Liquid

Received: Consecutive

Test Execution: Run consecutively

"Order" – Signed and held orders: New prewritten (held) medication orders and specific instructions from a licensed independent practitioner to administer medication(s) to a patient in clearly defined circumstances that become active upon the release of the orders on a specific date(s) and time(s)

Test Selection Workshop

Takeaways

USERS

- Ordering users / personas are not always oncologists (especially in US portal), so we need to accomodate different levels of clinical expertise and knowledge
- because of the wide range of potential users, we should consider role-based views and interactions in the portal

REFLEX

- Reflex is considered time-consuming and less preferable to concurrent ordering
- Reflex testing can be seen as a two-step decision at ordering to have "testing packages" / concurrently doing other tests, based on potential areas of concern
- also can be after reporting decision as well
- Reflex testing should support the physician's intent/goals for the patient, as well as help them find/support differential diagnoses

COMBO & STANDING ORDERS

Goals and the "why":

- Combo ordering is:
 - easy and quick
 - patient-centric (if DO & stage driven)
 - gets physician to a clinical decision more quickly
 - allows physicians to get the data/results they need with a minimum of effort on their part
 - does NOT ask for information we already have / minimizes time to select the right test(s)

Proposed Solutions:

- dynamic combos based on DO(+ stage, status, sample type availability) — suggestions change based on input from the user
- "set combos" similar to Tempus' offerings

Considerations:

- add-ons can have reimbursement issues
- need for DO logic tree
- adhering to standards of care
- higher chance of ABN's
- time to procure samples (esp tissue)

Examples:

- F1CDx + F1LCDx (concurrent testing for insurance)
- F1CDX RNA + DNA (concurrent)
- F1CDx + RNA + F1LCDx
- F1CDx + IHC
- F1LCDx + F1M
- F1CDx + germline (in future)
