Dear Hiring Team,

I've spent my career designing healthcare experiences that earn trust in high-stakes, emotionally charged moments. Maven's mission resonates deeply with me, and this role sits at an intersection I've been working toward: strategic design leadership, AI-native product thinking, and cross-functional ownership of a complex member journey.

At Foundation Medicine, I lead UX strategy for clinician portals, mobile-accessible diagnostic reports, and clinical decision support tools that help oncologists act on comprehensive genomic profiling with confidence. This work has forced me to get precise about questions Maven is now asking at scale: How does an AI communicate uncertainty without undermining trust? When should the system defer to a human clinician, and how do you design that handoff gracefully? I've built frameworks around these questions through research and close collaboration with clinical and data science partners — and a study on our reporting tools showed a 25% improvement in oncologist comprehension of treatment options as a direct result.

On AI fluency: I use Claude and Figma AI — for synthesis, rapid iteration, and building functional prototypes that move conversations past static mockups. I've used AI-assisted coding to prototype interaction models for clinical ordering flows, and I'm actively coaching the team around me to work the same way.

Earlier, at Highmark Health, I drove discovery that led to a new clinically tiered mental health strategy and a Medicare enrollment product that improved conversion by 15% — work that taught me how to move large cross-functional organizations toward a design vision without direct authority.

I'd love to talk about what end-to-end ownership of Maven's member experience could look like. Thank you for your consideration.

Sincerely,

A handwritten signature in black ink, appearing to read 'Erica Gatts', with a stylized flourish at the end.
